

Interactive, Data-Supported Assessments of Gentrification Risk Across Toronto

This is a sample demonstration of an AI-based tool that can be used to explore, analyze, and assess gentrification risk across Toronto's twenty-five wards, created using ArcGIS Instant Apps and NotebookLM. It can be accessed at <https://arcg.is/1nrOKi3>

Toronto: Gentrification Risk Level by Ward

Methodology

NotebookLM synthesizes data from Statistics Canada's **Ward Profiles** and the **City of Toronto's Open Building Permits dataset**, comparing demographic indicators against development activity. These two datasets were **uploaded to NotebookLM**, which effectively parsed over two hundred and fifty thousand open building permits and fifty-seven demographic indicators across twenty-five wards.

The five-tier risk categories were joined to the **Ward Boundaries** geospatial dataset available from the City of Toronto's Open Data Portal, and **visualized with a choropleth map using ArcGIS Online**. Using the Instant App, the viewer can click on any ward to read a brief overview assessment, and try the NotebookLM tool themselves, allowing viewers to query the tool using natural language.

This tool could easily be further developed by uploading additional sources to NotebookLM, or building a more advanced tool using an agentic AI model. Dynamic, evidence-based assessment tools could provide city planners and developers with valuable analytical support in identifying vulnerable populations and secondary impacts.
